# THE 2014-2015 ACADEMIC YEAR

The 2014-2015 academic year was a successful one for our school. We achieved many milestones and set new records. Our students excelled in academics, sports, and arts. We are proud of the hard work and dedication of our faculty and staff. The year was filled with challenges, but we overcame them all with a positive attitude and a strong sense of community. We look forward to another great year in 2015-2016.

We are proud to announce that our school has been recognized as a National Blue Ribbon School. This is a testament to the quality of our education and the hard work of our students and staff. We are committed to providing a world-class education for every student. We will continue to strive for excellence in all that we do.

Thank you to our parents, community, and donors for their support. We are grateful for the love and encouragement that has helped our students succeed. We will continue to work together to create a bright future for our school.

### Figure 1

Figure 1 shows the results of the regression analysis. The dependent variable is the number of days of absence due to illness. The independent variables are age, gender, and education. The results show that age has a positive effect on the number of days of absence due to illness. The coefficient for age is 0.02, which means that for every year increase in age, the number of days of absence due to illness increases by 0.02 days. Gender has a negative effect on the number of days of absence due to illness. The coefficient for gender is -0.05, which means that for every unit increase in gender (from male to female), the number of days of absence due to illness decreases by 0.05 days. Education has a positive effect on the number of days of absence due to illness. The coefficient for education is 0.01, which means that for every unit increase in education, the number of days of absence due to illness increases by 0.01 days.

## Section 11

The following are the questions and answers for the section 11. The questions are in bold and the answers are in regular text.

### Question 1: What is the definition of a function?

A function is a set of ordered pairs where each element in the domain is paired with exactly one element in the codomain. In other words, for every input, there is only one output.

Mathematically, a function  $f$  from a set  $A$  to a set  $B$  is a subset of the Cartesian product  $A \times B$  such that for every  $a \in A$ , there is exactly one  $b \in B$  such that  $(a, b) \in f$ .

Example: Let  $A = \{1, 2, 3\}$  and  $B = \{4, 5, 6\}$ . A function  $f$  from  $A$  to  $B$  could be  $f = \{(1, 4), (2, 5), (3, 6)\}$ .

Another example: Let  $A = \{1, 2, 3\}$  and  $B = \{4, 5, 6\}$ . A relation  $r$  from  $A$  to  $B$  could be  $r = \{(1, 4), (1, 5), (2, 6)\}$ . This is not a function because the element 1 in  $A$  is paired with two elements in  $B$ .

Graphically, a function can be represented on a coordinate plane. The graph of a function must pass the vertical line test: any vertical line intersects the graph at most once.

Example: The graph of  $y = x^2$  is a function because any vertical line intersects the parabola at most once.

Example: The graph of  $x = y^2$  is not a function because a vertical line can intersect the parabola at two points.

Example: The graph of  $y = |x|$  is a function because any vertical line intersects the V-shaped graph at most once.

### Question 2: How do you determine if a relation is a function?

There are several ways to determine if a relation is a function. The most common is the vertical line test on a graph. If a vertical line intersects the graph at more than one point, the relation is not a function. If it intersects at only one point for every possible vertical line, it is a function.

Another way is to look at the set of ordered pairs. For every element in the domain, there must be exactly one element in the codomain. If any element in the domain has two or more corresponding elements in the codomain, it is not a function.

Example: The relation  $r = \{(1, 4), (2, 5), (3, 6)\}$  is a function because each element in the domain has exactly one corresponding element in the codomain.

Example: The relation  $r = \{(1, 4), (1, 5), (2, 6)\}$  is not a function because the element 1 in the domain has two corresponding elements in the codomain.

Example: The relation  $r = \{(1, 4), (2, 5), (3, 6), (4, 7)\}$  is a function because each element in the domain has exactly one corresponding element in the codomain.

Example: The relation  $r = \{(1, 4), (2, 5), (3, 6), (2, 7)\}$  is not a function because the element 2 in the domain has two corresponding elements in the codomain.

Example: The relation  $r = \{(1, 4), (2, 5), (3, 6), (4, 7), (5, 8)\}$  is a function because each element in the domain has exactly one corresponding element in the codomain.

Example: The relation  $r = \{(1, 4), (2, 5), (3, 6), (4, 7), (3, 8)\}$  is not a function because the element 3 in the domain has two corresponding elements in the codomain.

Example: The relation  $r = \{(1, 4), (2, 5), (3, 6), (4, 7), (5, 8), (6, 9)\}$  is a function because each element in the domain has exactly one corresponding element in the codomain.

Example: The relation  $r = \{(1, 4), (2, 5), (3, 6), (4, 7), (5, 8), (4, 9)\}$  is not a function because the element 4 in the domain has two corresponding elements in the codomain.

### Question 3: What is the domain and range of a function?

The domain of a function is the set of all possible input values (x-values) that can be used in the function. The range is the set of all possible output values (y-values) that result from the function.

Example: For the function  $f(x) = x^2$ , the domain is all real numbers, and the range is all non-negative real numbers.

Example: For the function  $f(x) = |x|$ , the domain is all real numbers, and the range is all non-negative real numbers.

Example: For the function  $f(x) = \sqrt{x}$ , the domain is all non-negative real numbers, and the range is all non-negative real numbers.

Example: For the function  $f(x) = \frac{1}{x}$ , the domain is all real numbers except 0, and the range is all real numbers except 0.

# Hand and Wrist

Hand and wrist pain is a common condition that can significantly impact your quality of life. It can be caused by a variety of factors, including repetitive strain, trauma, and underlying medical conditions. Understanding the symptoms and causes is the first step towards effective treatment.

Common symptoms include pain, swelling, redness, and stiffness in the hand and wrist. You may also experience numbness, tingling, or weakness. These symptoms can be intermittent or constant, depending on the underlying cause.

Causes of hand and wrist pain include:

- Repetitive strain injuries (RSI)
- Trauma or injury
- Arthritis
- Carpal tunnel syndrome
- De Quervain's tenosynovitis
- Wrist sprains
- Hand and wrist fractures

Diagnosis of hand and wrist pain typically involves a physical examination and a medical history. Your doctor may also order imaging tests, such as X-rays, MRI, or ultrasound, to identify the underlying cause.

Treatment options for hand and wrist pain include rest, ice, heat, and over-the-counter pain relievers. In some cases, physical therapy, occupational therapy, or surgery may be necessary.

Prevention of hand and wrist pain involves taking breaks from repetitive activities, using proper ergonomics, and strengthening the muscles of the hand and wrist. Wearing a brace or splint can also help to support the hand and wrist.

Hand and wrist pain can be a challenging condition to manage, but with the right treatment and prevention strategies, you can reduce your pain and improve your quality of life. If you are experiencing hand and wrist pain, consult your doctor for a proper diagnosis and treatment plan.

Hand and wrist pain can be a sign of a more serious condition, such as arthritis or carpal tunnel syndrome. It is important to seek medical attention if you experience persistent pain or other symptoms. Early diagnosis and treatment can help to prevent long-term damage and disability.

## Wages 2010

Employees in the private sector received a 3.1% increase in wages in 2010, according to the Bureau of Economic Analysis. The increase was the largest since 2007, when wages rose 3.0%.

The increase in wages was driven by a combination of factors, including a decline in unemployment, a rise in the minimum wage, and a shift in the composition of the workforce. The minimum wage, which had been frozen at \$7.25 since 2009, was raised to \$7.50 in 2009 and to \$7.50 in 2010. The shift in the composition of the workforce was due to a decline in the number of workers in the manufacturing sector and a rise in the number of workers in the services sector.

The increase in wages was also driven by a decline in unemployment. The unemployment rate fell from 4.6% in 2009 to 4.4% in 2010, which helped to push up wages.

The increase in wages was also driven by a rise in the minimum wage. The minimum wage, which had been frozen at \$7.25 since 2009, was raised to \$7.50 in 2009 and to \$7.50 in 2010. The increase in the minimum wage helped to push up wages for low-wage workers.

The increase in wages was also driven by a shift in the composition of the workforce. The number of workers in the manufacturing sector fell from 13.5 million in 2009 to 13.1 million in 2010. At the same time, the number of workers in the services sector rose from 127.5 million in 2009 to 130.5 million in 2010.

The increase in wages was also driven by a decline in unemployment. The unemployment rate fell from 4.6% in 2009 to 4.4% in 2010, which helped to push up wages.
